Problem Statement

A problem statement clearly describes the issue faced by the users and explains why a solution is required. It helps identify the root cause of the problem and provides a clear direction for developing an effective solution. A well-defined problem statement ensures that the proposed system addresses the actual needs of the users.

For the **Help Desk Ticket Management System using ServiceNow**, employees experience delays in reporting and resolving IT-related issues due to manual support processes. The absence of a centralized ticket management system leads to inefficient communication, improper ticket assignment, lack of status tracking, and delayed issue resolution. These challenges reduce employee productivity and increase the workload on the IT support team.

The proposed system aims to automate the support ticket lifecycle by enabling employees to create tickets, automatically assigning them to the appropriate support team, providing real-time status tracking, generating notifications for critical tickets, and offering reports and dashboards for better monitoring and decision-making.

 I AM	Employees of an organization who face IT-related issues and require support from the IT help desk.
 I'M TRYING TO	Raise support requests quickly, get issues resolved, track ticket status, and receive timely updates.
 BUT	Manual ticket handling, no proper tracking, delayed assignment, lack of communication, and long resolution time.
 BECAUSE	Absence of a centralized system, manual processes, lack of automation, and ineffective communication between employees and IT teams.
 WHICH MAKES ME FEEL	Frustrated due to delays, worried about ticket status, uncertain about resolution, and dissatisfied with slow support.

Objectives

- To develop a centralized Help Desk Ticket Management System using ServiceNow.
- To enable employees to raise support tickets easily.
- To automate ticket assignment based on predefined rules.
- To provide real-time ticket status tracking.
- To send email notifications for critical tickets.
- To generate reports and dashboards for monitoring support activities.
- To improve communication between employees and the IT support team.
- To reduce manual effort and improve service efficiency.
