Data Flow Diagram

A Data Flow Diagram (DFD) is a graphical representation of how information moves through a system. It illustrates the flow of data between users, processes, and data stores while showing how information is processed at each stage.

For the Help Desk Ticket Management System using ServiceNow, the DFD represents the complete ticket lifecycle, beginning with ticket creation by an employee, automatic assignment to a support agent, ticket processing and status updates, email notifications for critical tickets, ticket closure by the manager, and finally the generation of reports and dashboards for monitoring support activities.
